

# Lynx Ultrabind

## SEDIMENT ULTRABINDING

Soil solidification used to be costly and time consuming. Traditional products add volume and weight increasing the number of trucks loads and creating higher transportation and dumping costs. **Lynx Ultrabind** replaces sawdust, peat moss, straw and other adsorbents.

## LYNX ULTRABIND BENEFITS

- Binds wet solids.
- Turns slurry into a solid mass.
- Reduced trucking, handling and storage costs.
- No vacuum or special trucks required.
- No requirement for adding absorbent material such as saw dust, straw, and peat. Less volume equals less cost.
- Environmental friendly.

Before and After

## BOUND MATERIALS

Once the soil has been sufficiently dewatered, **Lynx Ultrabind** powder can be added to the remaining mud to tackify the sediment for easy removal. This material can potentially be re-used for revegetation further saving money and resources.

Samples pictures showing the material in slurry and in bound form.
