

Clearflow

Floc Curtains™

Clearflow Floc Curtains and polishing channel field are typically installed downstream of Clearflow's Water Lynx Blocks as a final polishing mechanism for ultra fine sediment. The Floc Curtains have a large open weave to minimize hydraulic issues.

Unlike standard sediment curtains, which do not allow for flow and use retention time as key factor in sedimentation, Clearflow's Floc Curtains want the flow so that the ultra fine sediment can be captured and removed from the water column thus greatly reducing TSS (Total Suspended Solids).

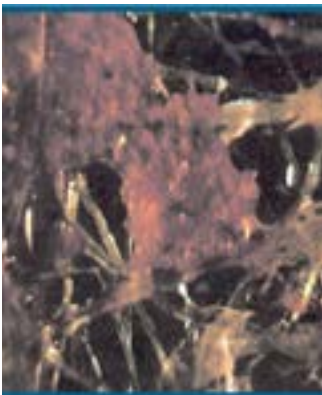

Floc Curtains

- Easy to install
- Allows for high flow
- Passive polishing mechanism for fine sediment
- Lasts up to 2 seasons

Great for use in:

- Ponds
- Creeks and rivers
- Canals
- Flow channels
